Live2D Cubism Core API Reference

Version r9 Last Update 2022/05/19

Changelog

Update day	Version	Update Type	Content	
2018/06/14	r2	translation	translation to English from Japanese	
2018/07/20	r3	Corrected	Corrected errors of snippet Corrected vague expression Corrected omissions of letter in snippet Added more detailed explanation about rendering method of mask and how to access Corrected mistake that const is included in notation of arguments.	
2019/02/26r5AddedAdded "File version of moc3" Added "Getting the parent parts of the Added the API description of csmGetLatestMocVersion Added the API description of csmGetMocVersion Added the API description of csmGetPartParentPartIndices		Added "Getting the parent parts of the parts" Added the API description of csmGetLatestMocVersion Added the API description of csmGetMocVersion Added the API description of		
2019/08/01	r6	Added	Added a constant stands for moc3 file version Added a snippet since the ConstantFlag element has added Added a description of the Inverted Mask flag Added a description of the Inverted Mask function Added an item stands for the available version of each API	
		Fixed	Typo fixes	
2019/09/04	r7	Fixed	Adjusted notation of "Cubism Core" and "Cubism SDK"	
2021/03/01	r8	Fixed	Added an explanation for the existence of Drawables with a count of 0 in csmGetDrawableIndexCounts.	
		Fixed	Added explanation of the case where csmGetDrawableIndices does not store valid addresses.	
2022/05/19	r9	Added	Added explanations of the function to obtain parameter keys.	
		Added	Added explanations of the multiply color and the screen colors.	

* Highlighted sentences mean the latest modification and addition.

Overall

Regarding this document

In this document, you can learn functions of Live2D Cubism Core (Core) in Live2D Cubism SDK, how to use it and specification of its API

Target

- Users of Live2D Cubism SDK

- Those who are considering embedding wrapper to call Core from other languages such as Java and Python

- Those who are considering embedding into other programs or platform such as game engines.

Functional classification of Core and Framework

The following chart shows the relationship between the Application and Core and Framework, and their roles.

Core is called from both Application and Framework.

•What is Core?

Core is a library including API necessary for handling models (.moc3 file) created with Live2D Cubism Editor. Its features are explained in the following.

- The API is coded by C language.

- The Core doesn't keep and discard Memory. It is necessary to keep the specified amount of Memory on users' side and provide it to the Core for its request.

- The core doesn't equip rendering function. The role of the Core is to calculate vertex information according to the parameters of a model. Applications or programs obtain calculated vertex information and information necessary for rendering (UV, opacity etc) from Core. Also, it doesn't needed to implement the rendering function for the Core since Framework provides reference implementation.

Due to the features written above, the core has high portability. Also it is not dependent on platforms.

How to render a model.

Different from Live2D Cubism 2 SDK, rendering function was separated from the Core after Live2D Cubism 3 SDK.

The advantage of this change is that it is possible for developers to embed Cubism into various environments.

The rendering function is provided in Framework as a reference implementation for popular use cases. Even in an environment that the function has not been provided, it is possible to have the function by obtaining 3D primitives information such as vertex information with the API of the Core and the rendering APIs specified for environment.

-Data for rendering provided by Core

The data that Core provides about models is classified into three major categories: Parameter, Part, and Drawable.

Among them, Drawable is a collection of data necessary for rendering.

Vertex information provided by Drawable is two-dimensional data which consists of X and Y. The starting point of coordinates for each element is bottom left. Also, the surface of the polygon is counter-clockwise.

The data is in accordance with the coordinate system of OpenGL.

-Cycles of Rendering and behavior of the Core

The following chart shows the flow of processing for loading a model file (.moc3).

Yellow node shows Application, purple node means a segment Framework should process. Nodes with arrow to the Core indicate calls to API of the Core.

The following chart shows the refresh cycle of rendering.

Same as the first chart, yellow node shows Application, purple node means a segment Framework should process. Nodes with arrow to the Core indicate calls to API of the Core. The sections surrounded by solid lines are simplified explanation .

How to use the API for each scene

How to obtain the information related to the Core.

• How to obtain the version information of the Core.

Version information of the Core currently used can be obtained

snippet:

csmVersion version = csmGetVersion();

Version notation consists of three parts: MAJOR, MINOR, and PATCH. Operation rule for each part is shown below.

Major version (1 byte) It is incremented when backward compatibility is lost with model data dew to some reason such as major version up of Cubism Editor.

Minor version (1 byte) It is incremented when function was added with backward compatibility kept.

Patch number (2 byte) It is incremented when the defect is fixed. If the major version or minor version is changed, the patch number is reset to 0.

0x 00 00 0000 Major Minor Patch

The version consists of 4 bytes. By treating it as an unsigned integer, the new Core version always means a larger number.

Link to the used API

csmGetVersion

•Output log of the Core.

In order to output the log of the Core, the function to output log can be preset. For example, if an error occurs when using the Core API, a log gets output through the preset function.

The function to output log that can be preset is the following.

```
snippet:
    /** Log handler.
    *
    * @param message Null-terminated string message to log.
    */
    typedef void (*csmLogFunction)(const char* message);
```

Example:

```
snippet:
void logPrint(const char* message)
{
    printf("[LOG] %s", message);
}
// Set Cubism log handler.
csmSetLogFunction(logPrint);
```

Link to the used API

csmSetLogFunction csmGetLogFunction

Loading files

How to load a Moc3 file and to expand up to the csmModel object

Model information is stored in moc3. It needs to be expanded up to csmModel object to be handled in Core .

After expanding it to csmModel, API needs to be operated with csmModel as the key. Memory area to generate object of csmMoc and csmModel needs to have address aligned by specified size.

Alignment size is written in the include.

```
Loading moc3
```

csmMoc* moc = csmReviveMocInPlace(mocMemory, mocSize);

Create a model from moc 3:

snippet: unsigned int modelSize = csmGetSizeofModel(moc);

// The model needs to be aligned as 16 bytes
void** modelMemory = AllocateAligned(modelSize, csmAlignofModel);

// Create an instance of the model
csmModel* model = csmInitializeModeIInPlace(moc, modelMemory, modelSize);

•File version of moc3

moc3 file format had a version up. New moc3 file may not be read in the old Core. Core has the compatibility to the moc3 file of the following corresponding version. csmGetLatestMocVersion shows the latest file version that Core can process.

```
/** moc3 file format version. */
enum
{
  /** unknown */
  csmMocVersion_Unknown = 0,
  /** moc3 file version 3.0.00 - 3.2.07 */
  csmMocVersion_30 = 1,
  /** moc3 file version 3.3.00 - 3.3.03 */
  csmMocVersion_{33} = 2,
  /** moc3 file version 4.0.00 - */
  csmMocVersion_40 = 3
};
/** moc3 version identifier. */
typedef unsigned int csmMocVersion;
* Gets Moc file supported latest version.
* @return csmMocVersion (Moc file latest format version).
*/
csmApi csmMocVersion csmGetLatestMocVersion();
/**
* Gets Moc file format version.
* @param address Address of moc.
* @param size Size of moc (in bytes).
* @return csmMocVersion
*/
csmApi csmMocVersion csmGetMocVersion(const void* address, const unsigned int size);
```

csmGetMocVersion shows the file version of moc3.

If it is not moc3 file, it returns csmMocVersion_Unknown = 0.

The execution order of csmGetMocVersion is not tied to the timing of the csmReviveMocInPlace.

To check whether the fire can be loaded by comparing the got file version and Core version.

Copyright © 2022 Live2D Inc. all rights reserved.

To expand to the model while examining the file version of moc3.

```
snippet:
  void* mocMemory;
  unsigned int mocSize;
  // Load file to memory address alined as 64byte.
  // The file size of .moc3 is stored in mocSize.
  mocMemory = ReadBlobAligned("Koharu/Koharu.moc3", csmAlignofMoc, &mocSize);
  const csmMocVersion fileVersion = csmGetMocVersion(mocMemory, mocSize);
  if( ( csmGetLatestMocVersion() < fileVersion ) ||
    (fileVersion == 0))
  {
    Log("can't load moc3 file");
    return;
 }
  csmMoc* moc = csmReviveMocInPlace(mocMemory, mocSize);
  unsigned int modelSize = csmGetSizeofModel(moc);
  // The model needs to be aligned as 16 bytes
  void** modelMemory = AllocateAligned(modelSize, csmAlignofModel);
  // Create an instance of the model
  csmModel* model = csmInitializeModeIInPlace(moc, modelMemory, modelSize);
```

If you attempt to load the new files with older versions of the Core, the return value of csmReviveMocInPlace will be NULL.

If the Core version from csmGetVersion() is 03.03.0000(50528256) or later, the message below will be output to the Core logs.

csmReviveMocInPlace is failed. The Core unsupport later than moc3 ver:2. This moc3 ver is 3.

Please do use the latest Core.

Release csmMoc or csmModel

csmReviveMocInPlace, csmInitializeModeIInPlace needs to be operated only within the input memory space.

The returned address is always the one in the prepared memory area.

csmMoc and csmModel exist in the memory area used for input in csmReviveMocInPlace,

csmInitializeModelInPlace. Accordingly the input memory area needs to be kept.

Also, csmMoc needs to be kept until all corresponding csmModels gets discarded.

This is because csmModel refers to csmMoc.

Release memory targeting not addresses of csmMoc or csmModel but its of mocMemory or modelMemory when csmMoc and csmModel. needs to be discarded.

Access to canvas information of model.

snippet:

csmVector2 size; csmVector2 origin; float pixelsPerUnit;

csmReadCanvasInfo(Sample.Model, &size, &origin, &pixelsPerUnit);

printf("size.X=%5.1f",size.X); // size.X = 2400.0 = (3) * (5) printf("size.Y=%5.1f",size.Y); // size.Y = 3000.0 = (4) * (5) printf("origin.X=%5.1f",origin.X); // origin.X = 1200.0 = (1) * (5) printf("origin.Y=%5.1f",origin.Y); // origin.Y = 1500.0 = (2) * (5) printf("pixelsPerUnit=%5.1f",pixelsPerUnit); // pixelsPerUnit = 2400.0 = (5)

csmReadCanvasInfo

Loading and placement Drawable

Drawable means an unit of drawing in the Core.

Drawable corresponds to an art mesh on the Editor.

Drawable has the necessary information to draw.

There are static information that does not change and dynamic information that changes by changing the value of the parameter in a data loaded from moc3. Static information can be cached in the application side.

The group having csmGet [XXXX] Count is structure of array (SOA). The number of arrays can be obtained by Count.

An array obtained with an API such as csmGetDrawableTextureIndices is the starting address of the array.

Arrays in each API have the same sequences. When it is necessary to look for a particular parameter, the parameter needs to be searched in the array obtained by csmGetDrawableIds.

Parameters, parts, etc are described the same manner.

The following chart shows the structure of the Drawable list.

When csmUpdateModel is executed, The blue API shows a static item. Also the Orange API shows a dynamic item.

In loading Drawable, preparation for attribute of the render such as registration to the graphics API or generation structure for drawing order sorting will be getting done.

        drawables[d].VertexPositions[i].z = 0;
        drawables[d].VertexUvs[i].x = vertexUvs[d][i].X;
        drawables[d].VertexUvs[i].y = vertexUvs[d][i].Y;
}
// vertexIndices [d] are all triangular notation indexCounts [d] always gets a multiple number of 3.
drawables[d].IndexCount
                                 = indexCounts[d];
drawables[d].Indices
                        = vertexIndices[d]; // Got as a single array
// Register values such as VertexPositions, VertexUvs, vertexIndices, etc. in the graphics API
drawables[d].Mesh = MakeMesh(drawables[d].VertexCount,
                                 drawables[d].VertexPositions,
                                 drawables[d].VertexUvs,
                                 drawables[d].IndexCount,
                                 drawables[d].Indices);
 // Access to other Drawable elements
drawables[d].ID
                                 = ids[d];
drawables[d].DrawOrder
                                 = drawOrders[d];
// The following three items are important on rendering.
drawables[d].Opacity
                         = opacities[d];
drawables[d].RenderOrder = renderOrders[d];
drawables[d].DynamicFlag = dynamicFlags[d];
drawables[d].MaskCount = maskCounts[d];
drawables[d].Masks = Allocate(sizeof(int) * maskCounts[d]);
for (m = 0; m < maskCounts[d]; ++m)</pre>
{
        drawables[d].Masks[m] = masks[d][m];
        // Numbers in masks are index of Drawable
        drawables[d].MaskLinks = &drawables[(masks[d][m])];
}
```

}

Vertex X,Y obtained by csmGetDrawableVertexPositions influenced PixelsPerUnit of canvas setting on export from Cubism Editor for embedding.

The value of X and Y are shown as a unit. The value can be call calculated by the following formula.

Export settings X
Export Version SDK 3.0 / Cubism3.0 Compatible (3.00.00) 🔽
Export Hidden Part
🗌 Export Guide Image
🗌 Export hidden ArtMesh
☑Export Physics settings file (physics3.json)
🗹 Export UserData file(userdata3.json)
Center of model X 0.50 Center of model Y 0.50 Set center Canvas scale (Unit) 1.00 Canvas height (Unit) 1.40 pixelsPerUnit 2976.00 Export Target 1/1 (2048 px)
OK Cance I

X = (localX / [5]) - ([1] * [3])Y = ([2] * [4]) - (localY / [5])

Vertex information whose aspect ratio has been kept is saved. Even if the vertex is beyond the boundary It'll be saved as it is. For more details, please refer to <u>"Area of DrawableVertexPotions"</u>

Manipulate the model

Acquiring each element of the parameter

It is necessary to understand each element of the parameter to manipulate the model. The following 5 things are the elements.

۰ID

- Present value
- Maximum value
- •Minimum value
- Initial value

Model

Access to the elements of each parameter

```
snippet:
 parameterCount = csmGetParameterCount(model);
 parameterIds = csmGetParameterIds(model);
 parameterValues = csmGetParameterValues(model);
 parameterMaximumValues = csmGetParameterMaximumValues(model);
 parameterMinimumValues = csmGetParameterMinimumValues(model);
 parameterDefaultValues = csmGetParameterDefaultValues(model);
 targetnum = -1;
 for( i = 0; i < parameterCount ;++i)</pre>
 {
   if( strcmp("ParamMouthOpenY",parameterIds[i]) == 0 )
   {
     targetnum = i;
     break;
   }
 }
 //In case that the desired ID could n't be found ID
 if(targetnum == -1)
 {
   return;
 }
// The minimum value, maximum value, initial value of "ParamMouthOpenY" parameter of the model is exported.
// min:0.0 max:1.0 default:0.0
printf("min:%3.1f max:%3.1f default:%3.1f", parameterMinimumValues[targetnum]
                                          , parameterMaximumValues[targetnum]
                                          , parameterDefaultValues[targetnum] );
```

Link to the used API

csmGetParameterCount csmGetParameterIds csmGetParameterValues csmGetParameterMaximumValues csmGetParameterMinimumValues csmGetParameterDefaultValues

-Getting the parent parts of parts

Pa	rt	Project		
K			0	>
0		\odot \neq	=	:
0	0	∼ Head		^
0	0	✓ → HairFront		
0	0	🍆 Hair Front 1	700	
O	0	🎙 Hair Front 2	700	
O	0	👯 Hair Front 1 Movement		
O	0	👯 Hair Front 2 Movement		
0	0	👯 Hair Front 1 Deformer XY		
0	0	👯 Hair Front 2 Deformer XY		
0	\sim	•• U.S. Faret 0 Defense 7		
	ا م ا	ne neede eftress structure		

Parts are made of tree structure.

This tree structure is created by the operation of the editor.

csmModel even holds the information of the structure that is generated from moc3. The results of csmGetPartParentPartIndices shows the parent of parts by index in array. When the parent number indicates the -1, it indicates that the parent is the Root.

snippet:

```
// Getting the ID list of parts.
const char** partIds =csmGetPartIds(model);
// Getting the parent of the index list of parts.
const int* parentPartIndices =csmGetPartParentPartIndices(model);
// If partParentIndex = -1, parent is empty.
// If partParentIndex> = 0, the value of parentPartIndices is the Index of the parent.
for (int i = 0; i < partCount; ++i)
{
  if(partParentIndex[i] == -1)
  {
     printf("partParentIndex[%d]:%s does not have a parent part.",i,partIds[i]);
  }
  else
  {
     printf("partParentIndex[%d]:Parent part of %s is %s.",i,partIds[i],partIds[parentPartIndices[i]]);
  }
```

Opacity operations to the parent part also applies to the opacity of the child.

Link to the used API

csmGetPartParentPartIndices

Operating parameters

In the operation to the Cubism model, operation of the parameter is reflected by acquiring the address of the array of parameters and writing the value.

It is clamped from the minimum value to the maximum value of the parameter when csmUpdateModel () is called.

If the repeat setting is made for the parameter, it will not be clamped.

```
snippet:
\parallel
parameterIds = csmGetParameterIds(model);
 parameterValues = csmGetParameterValues(model);
 parameterDefaultValues = csmGetParameterDefaultValues(model);
  // Scan array position corresponding to target ID
targetIndex = -1;
for( i = 0; i < parameterCount ;++i)</pre>
{
   if( strcmp("ParamMouthOpenY",parameterIds[i]) == 0 )
   {
     targetIndex = i;
     break;
   }
}
 //In case that the desired ID could n't be found ID
 if(targetIndex == -1)
 {
   return;
 }
  //Multiply the difference from reference value by the specified magnification ratio from the parameter.
  parameterValues[targetIndex] =
           (value - parameterDefaultValues[targetIndex]) * multipleValues[targetIndex] +
           parameterDefaultValues[targetIndex];
```

Link to the used API

csmGetParameterValues csmGetParameterDefaultValues

Operating parts opacity.

Operation of parts opacity can be done by the same way as operation of a parameter. It is reflected by acquiring the address of the array and writing the value to that memory.

It is clamped in the range of 0.0 to 1.0 by the processing of csmUpdateModel.

```
snippet:
// Manipulate opacity
partOpacities = csmGetPartOpacities(model);
  // Find parameter index.
targetIndex = -1;
for( i = 0; i < parameterCount ;++i)</pre>
{
   if( strcmp("ParamMouthOpenY",parameterIds[i]) == 0 )
   {
     targetIndex = i;
     break;
   }
}
 //In case that the desired ID could n't be found ID
 if(targetIndex == -1)
 {
   return;
 }
  partOpacities[targetIndex] = value;
}
```

Link to the used API

csmGetPartOpacities

-Applying the operation to the model.

After changing the opacity of a parameter or part, the operation must be reflected in the vertex and opacity of the actual Drawable.

This operation is done by csmUpdateModel.

csmResetDrawableDynamicFlags () is needed to be called before csmUpdateModel () in order to see which information necessary for drawing has been changed. For more details, refer to "Resetting DynamicFlag"

snippet:

// Update model.
csmUpdateModel(Model);

The affected parts here are...

csmGetDrawableDynamicFlags

csmGetDrawableVertexPositions

csmGetDrawableDrawOrders

csmGetDrawableRenderOrders

csmGetDrawableOpacities

Link to the used API

csmUpdateModel csmGetDrawableDynamicFlags csmGetDrawableVertexPositions csmGetDrawableDrawOrders csmGetDrawableRenderOrders csmGetDrawableOpacities

Reset of DynamicFlag

csmResetDrawableDynamicFlags executes writing the difference of the value between former one and current one to csmGetDrawableDynamicFlags

If this operation is skipped, only items of csmIsVisible will be updated by csmGetDrawableDynamicFlags.

csmGetDrawableDynamicFlags needs to be called right before csmUpdateModel which will be executed to rendering.

snippet:

// Reset dynamic drawable flags.
csmResetDrawableDynamicFlags(Sample.Model);

Link to the used API

csmResetDrawableDynamicFlags

Rendering

Necessary processes for rendering

For rendering, the following steps are necessary after the process for model.

- Updating Drawable vertices
- Updating opacity of Drawable
- -Sorting drawing order
- · Checking validity of Drawable if it is not valid rendering needs to be stopped.

Mask processing

- Multiply color
- Screen color

Also, rendering in Cubism has elements such as composition of opacity of textures, additive synthesis, multiplicative synthesis, culling, and invert the clipping mask or not.

When implementing rendering of the Cubism model, it is necessary to reproduce them in the same way as Editor does.

-Specification of rendering

Confirmation of Element with ConstantFlags

The synthesis method for each Drawable, on / off of culling, invert the clipping mask or not can be obtained with csmGetDrawableConstantFlags.

For the meaning of the obtained Flag, please refer to the constants in Live2DCubismCore.h

Either csmBlendAdditive or csmBlendMultiplicative will be applied.

Formula for color composition

When each color elements consists from 0.0 to 1.0 and D=RGBA(Drgb,Da) is set as color data to render color data S=RGBA(Srgb,Sa) already contained in the rendering target, render to calculate Output result O = RGBA (Orgb, Oa) gets

Normal synthesis $Orgb = Drgb \times (1 - Sa) + Srgb$ $Oa = Da \times (1 - Sa) + Sa$

Additive synthesis Orgb = Drgb + SrgbOa = Da

Multiplicative synthesis $Orgb = Drgb \times (1 - Sa) + Srgb \times Drgb$ Oa = Da Note that Multiplicative, when rendering target is buffer with alpha rendering will be failed if Multiplicative, Additive are applied on transparent background.

Culling direction and DrawableIndices

In DrawableIndices obtained from Core, counter-clockwise rotation is recognized as a surface.

Adjust the culling control in accordance with the rendering API to use.

Specification of Clipping

Clipping needs to be done by multiplying alpha value after all masks were combined for the rendering source.

In synthesis of multiple masks, opacity of Drawable is fixed as 1. Also, Normal synthesis is always applied regardless of specification of the method of synthesis. The opacity of textures needs to be applied.

Culling is applied in the same way as ordinary rendering method.

When the inverted mask of masked drawable is enabled, inverts the synthesized alpha value. Please refer to "<u>Apply mask on rendering</u>" for more details.

Confirmation of updated information

It may be helpful for acceleration of entire process that only items with changes such as vertex coordinates, opacity, rendering order of Drawable gets updated. Updated items can be obtained by csmGetDrawableDynamicFlags.

Checking DynamicFlag, updating vertex information and processing sort flag

```
snippet:
for ( d = 0; d < csmGetDrawableCount(model); d++)</pre>
{
       dynamicFlags = csmGetDrawableDynamicFlags(model);
       isVisible = (dynamicFlags[d] & csmlsVisible) == csmlsVisible;
       if ((dynamicFlags[d] & csmVertexPositionsDidChange) == csmVertexPositionsDidChange)
       {
               /*
                   update vertexes */
       }
       // Check whether drawables need to be sorted.
       sort = sort ||
            ((dynamicFlags[d] & csmRenderOrderDidChange) == csmRenderOrderDidChange);
}
if (sort)
{
       /* render order need sort */
```

}

Following 6 are information obtained by csmGetDrawableDynamicFlags.

snippet:
/** Bit masks for dynamic drawable flags. */ enum {
<pre>/** Flag set when visible. */ csmIsVisible = 1 << 0, /** Flag set when visibility did change. */ csmVisibilityDidChange = 1 << 1, /** Flag set when opacity did change. */ csmOpacityDidChange = 1 << 2,</pre>
/** Flag set when draw order did change. */ csmDrawOrderDidChange = 1 << 3, /** Flag set when render order did change. */ csmRenderOrderDidChange = 1 << 4, /** Flag set when vertex positions did change. */ csmVertexPositionsDidChange = 1 << 5
};

- -	
csmlsVisible	A bit is set when Drawable is displayed. Whether the parameter is outside the range of the key or calculation result of the opacity of Drawable is 0 the bit is put down.
csmVisibilityDidChange	A bit is raised when csmlsVisible changes from the previous state.
csmOpacityDidChange	A bit is raised when opacity of Drawable changed.
csmDrawOrderDidChange	A bit is raised when draw order of Drawable changed. Please note that it doesn't happen when the rendering order changed.
csmRenderOrderDidChange	A bit is raised when rendering order changes. Rendering order needs to be sorted.
csmVertexPositionsDidChange	A bit is raised when the VertexPositions changes.
csmBlendColorDidChange	A bit is raised when opacity of multiply color or screen

Explanation about each flag

color changed. Note that it is not possible to determine whether the multiply color or the screen color has been changed

Flow chart of Flag Confirmation Process

csmGetDrawableDynamicFlags

Obtaining the updated vertex information

The updated vertex information is received and the information is copied to the renderer. Updating the vertice information and opacity read at initialization is only necessary.

Updating the vertice information and opacity.

```
snippet:
// Initialize locals.
 dynamicFlags = csmGetDrawableDynamicFlags(renderer->model)
 vertexPositions = csmGetDrawableVertexPositions(renderer->Model);
 opacities = csmGetDrawableOpacities(renderer->Model);
for (d = 0; d < renderer->DrawableCount; ++d)
{
  // Update 'inexpensive' data without checking flags.
  renderer->drawables[d].Opacity = opacities[d];
  // Do expensive updates only if necessary.
  if ((dynamicFlags[d] & csmVertexPositionsDidChange) ==
csmVertexPositionsDidChange))
  {
     //Updating vertex information to graphics
     for( i = 0; i < renderer->drawables[d].vertexCount; ++i)
     {
        renderer->drawables[d].vertexPositons[i].x = vertexPositions[d][i].x;
       renderer->drawables[d].vertexPositons[i].y = vertexPositions[d][i].y;
     }
     UpdateGraphicsVertexPosition( renderer->drawables[d] );
  }
}
```

-Sorting drawing order of Drawable

DrawOrder changes by the change of parameter. As a result, if the RenderOrder changed, the calling order of the drawing needs to be changed.

DrawOrder and RenderOrder

The drawing order (DrawOrder) and the rendering order (RenderOrder) seem to be similar but different.

The drawing order is the value to be referred to for determination of the order of drawing on the art mesh on the Editor.

The value output by csmGetDrawableDrawOrders is the value in Cubism Editor's inspector. Calculation of drawing order group is not related.

Rendering order shows the order of actual rendering of Drawable relating with the drawing order

To get the rendering order csmGetDrawableRenderOrders (). needs to be called.

Process of initialization for sorting.

```
snippet:
    // Initialize static fields.
    for (d = 0, count = csmGetDrawableCount(model); d < count; ++d)
    {
        sortableDrawable[d].DrawableIndex = d;
    }
</pre>
```

Evaluation function for sorting

```
snippet:
static int CompareSortableDrawables(const void *a, const void *b)
{
    const SortableDrawable* drawableA = (const SortableDrawable*)a;
    const SortableDrawable* drawableB = (const SortableDrawable*)b;
    return (drawableA->RenderOrder > drawableB->RenderOrder) -
 (drawableA->RenderOrder < drawableB->RenderOrder);
}
```

Sort

```
snippet:
renderOrders = csmGetDrawableRenderOrders(model);
count = csmGetDrawableCount(model);
// Fetch render orders.
for (d = 0; d < count; ++d)
{
```

} // Sort.

sortableDrawable[d].RenderOrder = renderOrders[sortableDrawable[d].DrawableIndex];

qsort(sortableDrawable, count, sizeof(SortableDrawable), CompareSortableDrawables);

Access with sorting order on rendering

```
snippet:
for (d = 0, count = csmGetDrawableCount(model); d < count; ++d)
{
  target = &drawable[sortableDrawable[d].DrawableIndex];
  drawing( target );
}
```

Link to the used API

csmGetDrawableCount csmGetDrawableDrawOrders csmGetDrawableRenderOrders

Apply mask on rendering.

To find out which Drawable a Drawable is masked csmGetDrawableMaskCounts and csmGetDrawableMasks is used.

csmGetDrawableMaskCounts[d] can obtain the information that how many Drawable for masking d-th Drawable is masked with.

the number on array of i-th Drawable can be obtained csmGetDrawableMasks[d][i].

If there are multiple maskable Drawables, only alpha of each Drawable is synthesized. To synthesize for mask, Normal synthesize needs to be always applied even if Additive or Multiplicative are set as Blend mode of the Drawable.

Setting of culling needs to be set for synthesizing.

Even if a Drawable is used as a mask, sometime Drawable needs not to be displayed for needs for expression. Therefore value of the opacity on the Drawable is not used to synthesizing masks each other.

If the range of the alpha value is 0.0-1.0, by setting the alpha value of drawable for which inverted mask is enabled to "1.0 - synthesized alpha value", draw clipping with the mask inverted.

Apply the multiply color and screen color to the shader

Use csmGetDrawableMultiplyColors and csmGetDrawableScreenColors for the multiply color and the screen color of a Drawable.

The multiply color set for the dth Drawable can be obtained by

csmGetDrawableMultiplyColors[d], and the screen color by

csmGetDrawableScreenColors[d].

Each color set for the dth Drawable can be obtained with the type csmVector4, where X contains the value of R, Y the value of G, Z the value of B, and W the value of A.

If multiply color is not set, the initial value is set to (1.0f, 1.0f, 1.0f, 1.0f). This initial value is set as a value that does not affect the original color, as each RGB value is multiplied when applying the multiply color.

If screen color is not set, the initial value is set to (0.0f, 0.0f, 0.0f, 1.0f). This initial value is set as a value that does not affect the original color, as each RGB value is added when applying the screen color.

Gets the multiply color and screen color, and apply them to the shader

snippet:

/* All of called functions in the following snippet are tentative. */

/* multiply color */

const csmVector4* multiplyColor = csmGetDrawableMultiplyColors(model);

/* screen color */

const csmVector4* screenColor = csmGetDrawableScreenColors(model);

/* Apply the multiply color and screen color to the shader */
CubismShader_OpenGLES2::GetInstance()->SetupShaderProgram(
 this, drawTextureId, vertexCount, vertexArray,
 uvArray, opacity, colorBlendMode, modelColorRGBA,
 multiplyColor[drawableIndex], // multiply color
 screenColor[drawableIndex], // screen color
 isPremultipliedAlpha, mpvMatrix, invertedMask
);

Link to the used API

csmGetDrawableMultiplyColors csmGetDrawableScreenColors Copyright © 2022 Live2D Inc. all rights reserved.

Getting the parameter keys

Use csmGetParameterKeyCounts and csmGetParameterKeyValues to obtain the keys set for the parameters.

The number of keys set for the dth Parameter can be obtained by

csmGetParameterKeyCounts[d].

The position of the ith key set for the dth Parameter can be obtained by csmGetParameterKeyValues[d][i].

Gets the keys set for the parameters and the number of them

snippet:

}

/* All of called functions in the following snippet are tentative. */

/* Number of keys set for the parameters */ const int* keyCounts = csmGetParameterKeyCounts(_model);

/* Gets the position of each key set for the parameters */ const float** keyValues = csmGetParameterKeyValues(_model);

const csmChar** parameterIds =csmGetParameterIds(_model); const csmInt32 parameterCount = csmGetParameterCount(_model);

for (csmInt32 i = 0; i < parameterCount; ++i)

{
 printf("%s : %d\n", drawableIds[i], keyCounts[i]);
 for (csmInt32 j = 0; j < keyCounts[i]; ++j)</pre>

{
 printf("3.1%f\n", keyValues[i][j]);

SOA structure

If there is API called csmGet[XXXX]Count, arrays obtained by API group of csmGet[XXXX][YYYY]s are stored in the same order.

For more details, please refer to "Loading and placement Drawable".

InPlace

CsmReviveMocInPlace with InPlace and csmInitializeModeIInPlace indicates that they are APIs manipulate specified memory space.

For more details , please refer to "Release csmMoc or csmModel".

csmGetVersion

Return version information of The Core.

Argument

None

Return value

csmVersion(unsigned int)

Notation of the versions consists of three parts: MAJOR, MINOR, and PATCH. The followings are the rules for management of each part.

MAJOR version (1byte)

This is incremented when backward compatibility with model data (.moc3 file) has been lost by, for instance, by major version up of Cubism Editor.

MINOR version (1byte) This is incremented when new functions are added with backward compatibility kept.

PATCH number (2byte) This is incremented when defect failure has been fixed. If the MAJOR version or MINOR version is changed, the PATCH number is reset to 0.

0x 00 00 0000 Major Minor Patch

Version consists of 4 bytes. Also, the newer version of the Core always indicates the bigger number by treating it as unsigned integer.

Item with description

How to obtain version information of the Core.

Available version

csmGetLatestMocVersion

Returns the new file version that Core can process.

Argument

None

Return value

csmMocVersion(unsigned int)

Item with description

File version of moc3

Available version

3.3.01 or higher

csmGetMocVersion

Returns the moc3 file version from the loaded memory of .moc3 file.

Argument

void* address
 The address of the head of the data array which includes .moc3.

const unsigned int size
 .moc3 is the length of the data array which includes .moc3.

Return value

csmMocVersion(unsigned int)

```
/** moc3 file format version. */
enum
{
    /** unknown */
    csmMocVersion_Unknown = 0,
    /** moc3 file version 3.0.00 - 3.2.07 */
    csmMocVersion_30 = 1,
    /** moc3 file version 3.3.00 - 3.3.03 */
    csmMocVersion_33 = 2,
    /** moc3 file version 4.0.00 - */
    csmMocVersion_40 = 3
};
/** moc3 version identifier. */
typedef unsigned int csmMocVersion;
```

If the load is not a moc3 file returns the csmMocVersion_Unknown. Please be careful that there is a possibility that the value more than the value defined in the Live2DCubismCore.h will be got by the version-up of Cubism Editor. To find the file version or that you can use, please be compared with the results of csmGetLatestMocVersion.

Item with description

File version of moc3

Available version

3.3.01 or higher

csmGetLogFunction

Returns a pointer to the saved log function.

Argument

None

Return value

csmLogFunction (address)

Types of log functions

snippet:

*/

/** Log handler.

* @param message Null-terminated string message to log.

typedef void (*csmLogFunction)(const char* message);

Item with description

Output log of the Core.

Available version

csmSetLogFunction

Specify function to output logs

Argument

csmLogFunction handler

Return value

None

Item with description

Output log of the Core.

Available version

csmReviveMocInPlace

Play the csmMoc structure in a memory that .moc3 file is loaded. **The address passed by address must satisfy the default alignment.**

```
Description of the alignment size in the include file
```

```
snippet:
    /** Alignment constraints. */
    enum
    {
        /** Necessary alignment for mocs (in bytes). */
        csmAlignofMoc = 64,
     };
```

The played csmMoc structure needs be released after all csmModels generated from csmMoc has been released.

For more details, please refer to <u>"How to load a Moc3 file and to expand up to the csmModel object"</u>

Argument

void* address
 The address of the head of the data array which includes .moc3
 Alignment is necessary.

const unsigned int size
 .moc3 is the length of the data array which includes .moc3

Return value

csmMoc*
 Address to csmMoc structure
 It gets NULL when there is a problem.

Item with description

How to load a Moc3 file and to expand up to the csmModel object

Available version

csmGetSizeofModel

It returns the size of the Model structure generated from the Moc structure. This is used for securing memory.

Argument

• const csmMoc* moc Address to Moc structure

Return value

unsigned int
 Size of Model structure

Item with description

How to load a Moc3 file and to expand up to the csmModel object

Available version

csmInitializeModeIInPlace

It initializes the Model structure by the Moc structure. **Prepare the aligned memory.**

```
Description of the alignment size in the include file
```

```
snippet:
    /** Alignment constraints. */
    enum
    {
        /** Necessary alignment for models (in bytes). */
        csmAlignofModel = 16
     };
```

Argument

• const csmMoc* moc Address to Moc structure

void* address
 Address of allocated memory

• const unsigned int size Size of allocated memory

Return value

csmModel*

Item with description

How to load a Moc3 file and to expand up to the csmModel object

Available version

csmUpdateModel

It reflects the operation of parameters and parts on vertex information and so on.

Argument

•csmModel* model Address to model structure

Return value

None

Item with description

Applying the operation to the model

Available version

csmReadCanvasInfo

It returns the canvas size, center point and unit size of the model.

Argument

const csmModel* model
 Address to model structure

csmVector2* outSizeInPixels
 Address to csmVector 2 for storing model canvas size

•csmVector2* outOriginInPixels Address to csmVector 2 to store the center point of the model canvas

float* outPixelsPerUnit
 Unit size of model

Return value

None

Item with description

Get rendering size of model

Available version

csmGetParameterCount

It returns the number of parameters owned by the model.

Argument

• const csmModel* model Address to model structure

Return value

int
 Number of parameters to hold

Item with description

Acquiring each element of the parameter

Available version

csmGetParameterIds

It returns the array address which stores the ID of the parameter of the model.

Argument

• const csmModel* model Address to model structure

Return value

const char**
 Address to the array where string address is stored

Item with description

Acquiring each element of the parameter

Available version

csmGetParameterMinimumValues

It returns an address to an array which stores only the minimum value of the parameter.

Argument

• const csmModel* model Address to model structure

Return value

const float*
 Address to the array containing the minimum value

Item with description

Acquiring each element of the parameter

Available version

csmGetParameterMaximumValues

It returns an address to an array which stores only the maximum value of the parameter.

Argument

• const csmModel* model Address to model structure

Return value

const float*
 Address to the array containing the maximum value

Item with description

Acquiring each element of the parameter

Available version

csmGetParameterDefaultValues

Ir returns an address to an array which stores only the default values of parameters.

Argument

• const csmModel* model Address to model structure

Return value

const float*
 Address to the array containing the default value

Item with description

Acquiring each element of the parameter Operating parameters

Available version

csmGetParameterValues

It returns an address to an array of just the current values of the parameters. **Manipulate the model by writing to this array.**

Argument

•csmModel* model Address to model structure

Return value

const float*
 Address to the array where the current value is stored.

Item with description

Acquiring each element of the parameter Operating parameters

Available version

Copyright © 2022 Live2D Inc. all rights reserved.

csmGetParameterKeyCounts

Address to the array storing the numbers of keys set for the parameters

<mark>Argument</mark>

const csmModel* model
 Address to model structure

Return value

const int*
 Address to the array storing the numbers of keys set for the parameters

Item with description

Getting the parameter keys

Available version

Copyright © 2022 Live2D Inc. all rights reserved.

csmGetParameterKeyValues

Returns the address to the jagged array storing the positions of keys set for the parameters.

<mark>Argument</mark>

const csmModel* model
 Address to model structure

Return value

const float**
 Address to the jagged array storing the positions of keys set for the parameters

Item with description

Getting the parameter keys

Available version

csmGetPartCount

It returns the number of parts the model. http://docs.live2d.com/cubism-editor-manual/parts/

Argument

• const csmModel* model Address to model structure

Return value

∙int
 Number of parts

Item with description

None

Available version

csmGetPartIds

It returns the address to the array which stores the part ID of the model.

Argument

const csmModel* model
 Address to model structure

Return value

const char**
 Address to the array where string address is stored

Item with description

None

Available version

csmGetPartOpacities

It returns the address to the array which stores the current value of the opacity of the part of the model.

Argument

•csmModel* model Address to model structure

Return value

float*
 Address of part opacity array

Item with description

Operate parts opacity

Available version

csmGetPartParentPartIndices

It returns the the parent of the parts by index in array. If the parent of the part is Root, -1 will be stored

Argument

•csmModel* model Address to model structure

Return value

const int*
 Address of the array stored the index to the parent of the parts

Item with description

Gets the parent parts of parts

Available version

csmGetDrawableCount

It returns the number of Drawables the model.

Argument

• const csmModel* model Address to model structure

Return value

int
 Number of Drawables the model has

Item with description

Loading and placement Drawable Sorting drawing order of Drawable

Available version

csmGetDrawableIds

Returns the address to the array which stores the ID of the model possessed by the model.

Argument

• const csmModel* model Address to model structure

Return value

const char**
 Address to the array where string address is stored

Item with description

Loading and placement Drawable

Available version

csmGetDrawableConstantFlags

It returns the address to the array which stores the static flags of the Drawable possessed by the model. The flags described here contain the following four elements flags regarding blend of rendering • Add rendering • Multiply rendering flag for culling of Drawable • Double-sided rendering Flag of the mask of Drawable (Added since 4.0.0) • Inverted mask

Argument

const csmModel* model
 Address to model structure

Return value

const csmFlags*
 Address for array of a flag

snippet:
 /** Bitfield. */
 typedef unsigned char csmFlags;

Item with description

Loading and placement Drawable

Available version

csmGetDrawableDynamicFlags

It returns the address to the array which stores the flags updated when drawable owned by the model gets rendered.

The flags updated on rendering contain the following six elements.

- Visibility of rendering
- Change of visibility of rendering
- Change of opacity
- Change of rendering order
- ·Replacement of rendering order
- Vertex information update

Argument

• const csmModel* model Address to model structure

Return value

const csmFlags*
 Address for the array of flag

snippet:
 /** Bitfield. */
 typedef unsigned char csmFlags;

Item with description

Loading and placement Drawable Applying the operation to the model Confirmation of updated information Obtaining the updated vertex information

Available version

csmGetDrawableTextureIndices

It returns the address of the array which stores the texture number referred to by the drawable owned by the model.

The texture number means the number given to the texture atlas to which the art mesh belongs.

Argument

• const csmModel* model Address to model structure

Return value

const int*
 Address of the array containing the texture number

Item with description

Loading and placement Drawable

Available version

csmGetDrawableDrawOrders

It returns the address for the array which stores the drawing order of the drawing possessed by the model.

Based on the current parameter value, this value stores the interpolated calculation result. The influence of the rendering order group is ignored.

Argument

• const csmModel* model Address to model structure

Return value

const int*
 Address for the array containing the rendering order

Item with description

Loading and placement Drawable Applying the operation to the model Sorting drawing order of Drawable

Available version

csmGetDrawableRenderOrders

It returns the address for the array which stores the rendering order of the drawing possessed by the model.

It rendered in the same order as displayed in Cubism Editor.

Argument

• const csmModel* model Address to model structure

Return value

const int*
 Address for the array containing the rendering order

Item with description

Loading and placement Drawable Applying the operation to the model Sorting drawing order of Drawable

Available version

csmGetDrawableOpacities

It returns the address for the array which stores the opacity value of the Drawable possessed by the model. The value will be between 0.0 and 1.0.

Argument

• const csmModel* model Address to model structure

Return value

const float*
 Address for array containing opacity

Item with description

Loading and placement Drawable Applying the operation to the model Confirmation of updated information Obtaining the updated vertex information

Available version

csmGetDrawableMaskCounts

It returns an address to an array which stores the number of Drawable owned by the model.

Argument

• const csmModel* model Address to model structure

Return value

const int*
 Address for the array containing the number of masks

Item with description

Loading and placement Drawable Apply mask on rendering

Available version

csmGetDrawableMasks

It returns the address of the jagged array which stores the Drawable number of the masks of Drawable owned by the model.

Handle it carefully since 0 in csmGetDrawableMaskCounts contains address information used in other masks in Drawable.

Argument

• const csmModel* model Address to model structure

Return value

const int**
 Address for the array of addresses containing mask reference number

Item with description

Loading and placement Drawable Apply mask on rendering

Available version

csmGetDrawableVertexCounts

It returns the address for the array which stores the number of vertices of the drawable possessed by the model.

Argument

• const csmModel* model Address to model structure

Return value

const int*
 Address for an array containing the number of vertices of Drawable

Item with description

Loading and placement Drawable Apply mask on rendering

Available version

csmGetDrawableVertexPositions

It returns the address to the jagged array which stores the vertex of the drawable possessed by the model.

Argument

• const csmModel* model Address to model structure

Return value

const csmVector2**
 Address to jagged array to vertex information

```
snippet:
/** 2 component vector. */
typedef struct
{
    /** First component. */
    float X;
    /** Second component. */
    float Y;
}
csmVector2;
```

Item with description

Loading and placement Drawable Applying the operation to the model Confirmation of updated information Obtaining the updated vertex information

Available version

csmGetDrawableVertexUvs

It returns the address to the jagged array which stores the UV information of Drawable possessed by the model.

Since it corresponds to each vertex, the number of vertex get obtained with csmGetDrawableVertexCounts.

Argument

• const csmModel* model Address to model structure

Return value

const csmVector2**
 Address to jagged array to vertex information

Item with description

Loading and placement Drawable

Available version

csmGetDrawableIndexCounts

It returns the address of an array which stores the size of the corresponding number array of polygons against the vertex of the model possessed by the model.

Since it becomes an array describing which corner of a triangle corresponds each vertex, the value stored in this array always gets 0 or a multiple of 3.

Note that the size of Indices becomes zero at the end of skinning.

Argument

• const csmModel* model Address to model structure

Return value

const int*
 address of an array that stores the size of the corresponding number array of polygons.

Item with description

Loading and placement Drawable

Available version

csmGetDrawableIndices

It returns the address to the jagged array which corresponds Drawable number of the vertexes of Drawable owned by the model.

Each drawable has stored number which is independent.

Handle it carefully since 0 in csmGetDrawableIndexCounts contains address information used in other Drawable.

Argument

• const csmModel* model Address to model structure

Return value

const unsigned short**
 Address to the corresponding number of jagged array.

Item with description

Loading and placement Drawable

Available version

csmResetDrawableDynamicFlags

In order to refresh the information obtained by csmGetDrawableDynamicFlags at the next csmUpdateModel, all flags needs to be taken down. The timing for the call is right after the drawing process is over.

Argument

•csmModel* model Address to model structure

Return value

None

Item with description

Reset of DynamicFlag

Available version

csmGetDrawableMultiplyColors

Returns the address to the array storing the multiply colors of ArtMeshes.

Argument

csmModel* model
 Address to model structure

Return value

const csmVector4*
 Address to the array storing the RGBA values of the multiply color of ArtMeshes
 X corresponds to R, Y to G, and Z to B (Value of W currently unused)

snippet: /** 4 component vector. */ typedef struct { /** 1st component. */ float X; /** 2nd component. */ float Y; /** 3rd component. */ float Z; /** 4th component. */ float W; } csmVector4;

Item with description

Getting the multiply colors and screen colors

Available version

Copyright © 2022 Live2D Inc. all rights reserved.

csmGetDrawableScreenColors

Returns the address to the array storing the screen colors of ArtMeshes.

Argument

csmModel* model
 Address to model structure

Return value

const csmVector4*
 Address to the array storing the RGBA values of the screen color of ArtMeshes
 X corresponds to R, Y to G, and Z to B (Value of W currently unused)

snippet: /** 4 component vector. */ typedef struct { /** 1st component. */ float X; /** 2nd component. */ float Y; /** 3rd component. */ float Z; /** 4th component. */ float W; } csmVector4;

Item with description

Getting the multiply colors and screen colors

Available version
